

Kitting Services

Micronova ICS provides comprehensive kitting services tailored to your product and process needs. From ordering components to shipping sterile kits, we manage every step. We offer stability studies, irradiation, validation, quarterly dose audits, sterility testing, and certificates. Our facilities and experts are ready to support you.

Ordering and storing components: Our team manages the entire process of ordering, receiving, and storing your components. We utilize a validated ERP system that includes batch records, inventory control, labels, and lot traceability. Our warehouses are secure, climate-controlled facilities with pest management.

Cleanrooms: Our cleanrooms meet ISO 146644-1 standards. All cleanroom technicians are highly trained. We maintain a comprehensive environmental monitoring program for our cleanrooms.

Stability studies: Our team can perform stability testing and provide data to determine and confirm the shelf life of your product. This includes all required documentation and the final summary report.

Gamma Irradiation Processing: This method effectively treats a wide range of products made from various materials with different densities, configurations, and orientations. The ISO 11137 standard supports this process. Our experts can assist you with validation and routine quarterly dose audits.

Sterility: Our specialists can assist with sterility testing of your product or kit, particularly if you wish to conduct batch-by-batch testing before releasing your product.

Certificates: All products and kits include certificates before release. The final step is to create a certificate that contains all the information and quality approval.

Please feel free to contact our team to discuss your project.
